

Using Nail-On Roof Clips to Install Heat Cable on Metal Roofs

Tips for Installing Clips on Metal roofs:

You can use nail-on roof clips (IDP-113) to install heat cable on your metal roof using one of two common methods.

Method One: On the Flat Clip 'A' is an unmodified unit. You can use two gasketed sheet metal screws (C) to fasten the clip directly into your metal roof.

Method Two: On the Rib Clip 'B' is modified with some pliers. It is bent to the approximate shape of the rib (it doesn't need to be perfect). You can use two gasketed sheet metal screws (C) to fasten the clip directly into the top of the rib as shown.

Caulk & Sealant

Some installers screw the clips directly into the roof without any additional sealants but some choose to apply a small dot of silicone caulk to the underside of the clip before fastening.
